

# IN5290 Ethical Hacking

## Lecture 11: Vulnerability scanners

Laszlo Erdödi

laszloe@ifi.uio.no

# Lecture Overview

- Vulnerability databases
- Characteristics and application of automatic web security scanners

# Vulnerability databases

Vulnerabilities are registered in a database, each vulnerability has a unique identification number.

Common Vulnerabilities and Exposures (CVE) E.g.: CVE-2015-7297

**Vulnerability Details :** [CVE-2015-7297](#) (2 Metasploit modules)

SQL injection vulnerability in Joomla! 3.2 before 3.4.4 allows remote attackers to execute arbitrary SQL commands via unspecified vectors,  
Publish Date : 2015-10-29 Last Update Date : 2017-09-12

**– CVSS Scores & Vulnerability Types**

|                        |  |
|------------------------|--|
| CVSS Score             | <b>7.5</b>   |
| Confidentiality Impact | <b>Partial</b> (There is considerable informational disclosure.)   |
| Integrity Impact       | <b>Partial</b> (Modification of some system files or information is possible, but the attacker does not have control over what can be affected is limited.)    |
| Availability Impact    | <b>Partial</b> (There is reduced performance or interruptions in resource availability.)   |
| Access Complexity      | <b>Low</b> (Specialized access conditions or extenuating circumstances do not exist. Very little knowledge or skill is required to exploit the vulnerability.) |
| Authentication         | <b>Not required</b> (Authentication is not required to exploit the vulnerability.)   |
| Gained Access          | <b>None</b>  |
| Vulnerability Type(s)  | Execute Code Sql Injection   |
| CWE ID                 | <a href="#">89</a>   |

# Vulnerability databases

Common Weakness Enumeration (CWE)

It contains vulnerability types, e.g. CWE-89

## CWE - 89 : Improper Sanitization of Special Elements used in an SQL Command ('SQL Injection')

|                            |  |
|----------------------------|--|
| CWE Definition             | <a href="http://cwe.mitre.org/data/definitions/89.html">http://cwe.mitre.org/data/definitions/89.html</a>  |
| Number of vulnerabilities: | <a href="#">5077</a>   |
| Description                | The software constructs all or part of an SQL command using externally-influenced input from an upstream component, but it does not sanitize or incorrectly sanitizes special elements that could modify the intended SQL command when it is sent to a downstream component. Without sufficient removal or quoting of SQL syntax in user-controllable inputs, the generated SQL query can cause those inputs to be interpreted as SQL instead of ordinary user data. This can be used to alter query logic to bypass security checks, or to insert additional statements that modify the back-end database, possibly including execution of system commands. |
| Background Details         |  |
| Other Notes                |  |

# Vulnerability categories

Vulnerabilities By Type

| Year                 | # of Vulnerabilities | DoS                   | Code Execution        | Overflow              | Memory Corruption    | Sql Injection        | XSS                   | Directory Traversal  | Http Response Splitting | Bypass something     | Gain Information     | Gain Privileges      | CSRF                 | File Inclusion       | # of exploits        |
|----------------------|----------------------|-----------------------|-----------------------|-----------------------|----------------------|----------------------|-----------------------|----------------------|-------------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|

# Automatic vulnerability scanners

Automatic tools can carry out fast vulnerability identification. They have huge vulnerability databases that contain the requests that have to be sent for checking a vulnerability. Based on the answer the scanner decides whether the vulnerability exists or not. The main characteristics of the scanners are:

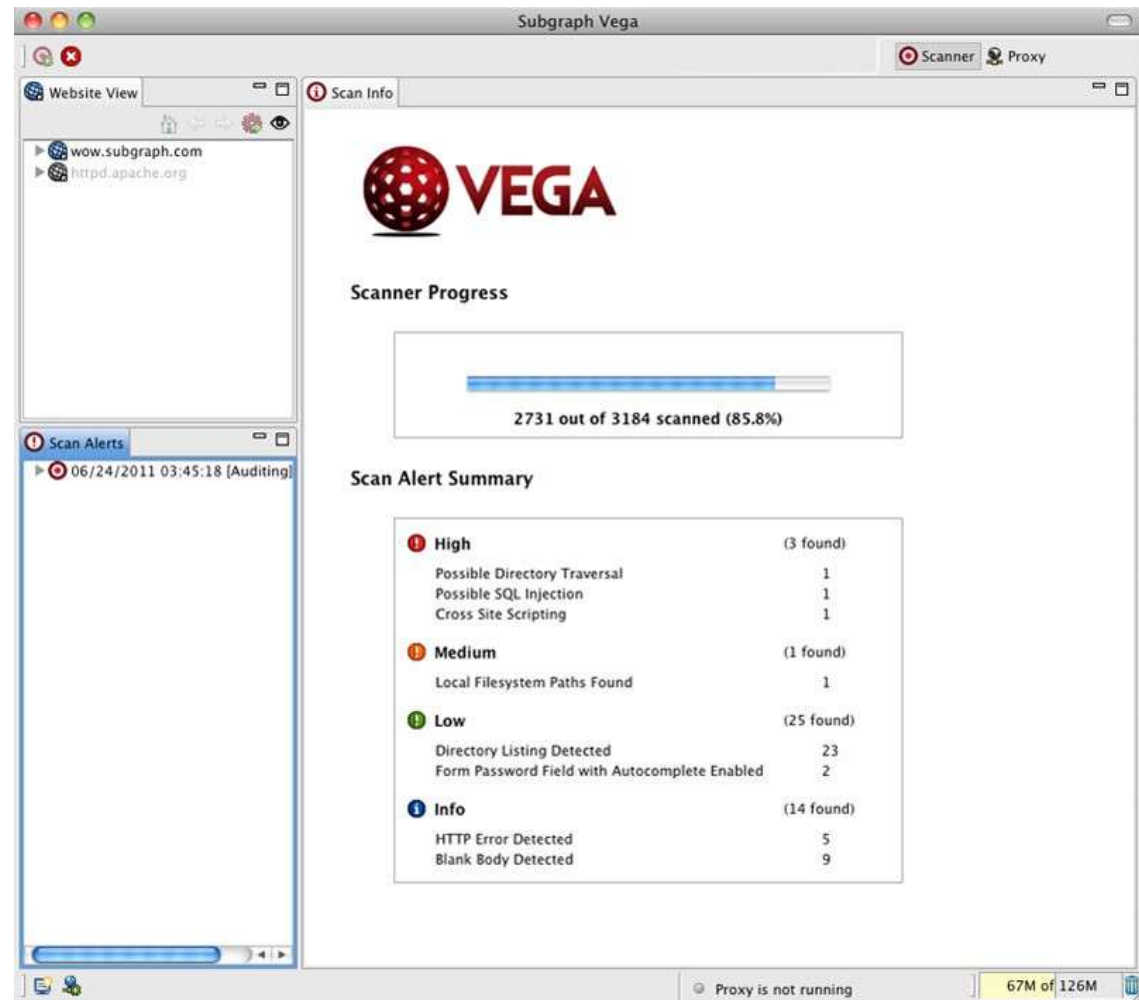

- working with predefined web requests,
- since the complexity is not too high (they cannot really find connections between actions), usually they have several false positives,
- the identified vulnerabilities are categorized according to the severity (critical, high, medium, low, information disclosure),
- scans usually can be customized (which scripts to run),
- tools can be trained how to login to a password protected web area.

# Web vulnerability scanners - VEGA

Vega is a free and open source web security scanner and web security testing platform to test the security of web applications.
